

Filling, sending and receiving containers

You are the person who puts product into a container, sends it out, takes it back, washes it and gets it ready to go again. Clariq records each of those in about ten seconds on your phone.

Who this is for	Warehouse operators
Reading time	About ten minutes, and you will not need it again
What you need	A phone with a camera, and your work email address
The golden rule	Scan first. The container tells the app which one it is

Your part of the loop

You cannot get the order wrong. Clariq only ever offers you the steps that make sense for the container in your hand. If a button is not there, that step is not due yet.

Your home screen

Everything you need is on this screen. Everything else is folded into the Menu at the top right.

Signing in, once

1. Open clariq-hub.netlify.app in your phone browser

Type `clariq-hub.netlify.app` into Safari or Chrome. There is nothing to install.

2. Type your work email address, tap **Send me a link**

There is no password to remember. Clariq emails you a link that signs you in.

No email after a minute? Look in junk mail. The sender is Clariq.

3. Add Clariq to your home screen

iPhone: share button, then **Add to Home Screen**. Android: three dots, then **Install app**. After that it is one tap, and you stay signed in for 30 days.

Filling and sending out

1. Scan the container

Tap **Scan a container** and point the camera at the label. The card opens with the container number at the top.

2. Tap Fill

Choose the product and the batch. If there is only one batch open, it is chosen for you. The amount is already filled in with the container's own size, so change it only if you put in less.

You will see: a warning, not a block, if the last product in this container was a different type. You decide.

3. Tap Dispatch it now on the Done screen

Right after a fill, Clariq offers the next step. Choose the customer and the site. The last customer you used is remembered, and the date it is due back is already set to 60 days.

4. Give it to the driver

The container is now **With customer**. It shows on the overdue list if it has not come back by the due date.

Printing labels for new containers

Menu, then **Print new labels**. Say how many containers and what type, and Clariq gives you a PDF laid out for the label sheets. Each label carries its own number and QR code. Stick them on, then scan each one and do the first inspection.

A spoiled label is not a problem. Scan it, tap **Void**, give the reason. The number is retired, never reused, and the record says why.

Taking a container back

Three steps, always in this order. Clariq will not let you skip one, which is the point.

1. Scan it and tap Return

Four quick questions about what you can see: is the cap on, is there residue, any sign of contamination, any visible damage.

What happens: all clear sends it to **Awaiting wash**. Anything concerning sends it to **Quarantined**, where it waits for somebody who can authorise a decision.

2. Wash it, then record the wash

Scan, tap **Wash**, choose the method and the outcome. It moves to **Awaiting inspection**.

3. Inspect it and give it a grade

A to E. The grade is the decision, so there is no second step to remember.

Grade	Means	Where it goes
A	Excellent	Back in stock, ready to fill
B	Good	Back in stock
C	Serviceable	Back in stock, flagged to watch
D	Not fit to use	Quarantined. Give the reason
E	End of its life	Retired. Give the reason and the weight

Photos help. Any damage, take a photo while you are looking at it. It is attached to that inspection for good, and it settles arguments later.

What you can and cannot do

✓ You can

- Create containers and print labels
- Fill, dispatch, return, wash and inspect
- Record recycling when a container reaches the end
- See every container and every report
- Add a photo or a note to anything

X You cannot

- Add or change customers, sites or products
- Release a container from quarantine, unless you have been given that permission
- Change anybody's role, or the settings
- Edit or delete anything already recorded

If something goes wrong

What you see	What it means, and what to do
Can't reach Clariq	No phone signal where you are standing. Nothing was recorded and nothing was lost. Move to where you have signal and tap again.
The camera will not open	The app names the reason: permission not given, no camera, camera busy in another app, or an insecure address. Fix that one thing, tap retry.
The button I want is not there	That step does not make sense for this container yet. The buttons you see are always the ones that are allowed right now.
I recorded the wrong thing	Tell an Admin. Nothing is ever deleted, so they record a correction and both entries stay in the history. Do not try to hide it.

The ? on every screen

Top right of the title. It opens the help for that exact screen, not a search box.

Ask Clariq

Type a question the way you would say it: "how do I print labels". You get the steps and a button that takes you there.

Containers that are not ours

On an audit walk you will meet containers that are not ours: the customer's own bottles, and other suppliers' drums. They belong on that organisation's register and are theirs to record, so the app will not let you sight them. That is deliberate, not a fault.

Keep this by the bench

Every job starts the same way

Scan the container, then pick the action.

The container is	You tap
Empty, clean, inspected	Fill
Full, waiting to go	Dispatch
Just back from a customer	Return , then the four questions
Returned and waiting	Wash
Washed	Inspect , then the grade
Damaged, and you are not sure	Quarantine , and say why
Finished for good	Retire , then recycling when it is collected

If you are not sure

Quarantine it and say why. Nothing is lost by holding a container for a day, and somebody with authority makes the call.

If the app says no

The step is not due yet. Scan the container and read the buttons you are offered: that list is always the list of things allowed right now.
