

Customers, reports and deposits

You do not move containers. You look after the relationship: who has what, what is late, what is owed, and the report that shows a customer what their year looked like.

Who this is for	Sales and account managers
Reading time	Ten minutes
What you need	A laptop or a phone, and your work email address
The golden rule	Every number you quote comes from the record, so you never have to hedge

What you actually do in here

The report is the sales tool. A customer who receives a clear monthly report stops treating containers as somebody else's problem, and your overdue list gets shorter without a single phone call.

Your home screen

Reports first, because that is what you are here for.

Signing in, once

1. Open `clariq-hub.netlify.app` in your phone browser

Type `clariq-hub.netlify.app` into Safari or Chrome. There is nothing to install.

2. Type your work email address, tap **Send me a link**

There is no password to remember. Clariq emails you a link that signs you in.

No email after a minute? Look in junk mail. The sender is Clariq.

3. Add Clariq to your home screen

iPhone: share button, then **Add to Home Screen**. Android: three dots, then **Install app**. After that it is one tap, and you stay signed in for 30 days.

Setting up and looking after a customer

1. Menu, then Customers and their sites

Add the customer: legal name, trading name, contact, email, phone. Clariq gives them a number such as CUS-0004.

2. Add their sites

One per delivery address, with the delivery and collection instructions that actually matter to a driver.

Note: if the customer runs Clariq themselves, their sites belong to them and you will see them rather than create them.

3. Add the products they buy

With the safety data sheet link. That link is what their staff see when they scan a container.

4. Agree the return arrangement and the deposit

Per container, on account, or none. It drives the deposits ledger and what appears on their report.

5. Consider inviting them as an organisation

That gives them their own Clariq, their own register and their own people. It is the difference between a customer who returns containers and one who runs a process. Ask an Admin if you cannot see the option.

The overdue conversation, made easy

Open **What is overdue for return**, filter to your customer, and you have the number of containers, the days outstanding and the replacement value at risk. That is a factual conversation rather than an awkward one.

The reports, and what each is for

Report	What it shows	Use it for
Report for a customer	Their containers, cycles, returns, what is still out, by site where they have more than one	Monthly account contact, contract review
Chemicals on site	What they are holding right now and where	Before a visit, and for their safety people
Reuse results	Reuse and recovery figures for the period	Their sustainability reporting, and your proposals
Deposits	Charged, refunded, forfeited and the balance	Billing queries

How to talk about the reuse figures

They are labelled *prepared with reference to the measurement framework of ISO 59020:2024*. Say exactly that. It means the figures follow the structure of the international standard for measuring circularity, and it does not claim anybody has certified them.

If a customer asks whether Clariq is certified, the answer is no, and the next sentence is the strong one: nobody in this market is, and anyone who says they are should be asked who assessed them and when.

✓ You can

- Add and edit customers, sites and products
- Run and export every report
- See the deposits ledger
- See every container and where it is

X You cannot

- Fill, dispatch, wash or inspect anything
- Change roles, people or settings
- Edit a recorded event
- See inside a customer organisation's own records

Chemicals we do not supply

Menu, Reports, Chemicals we do not supply. This is the opportunity list: what each customer holds in another supplier's packaging, by site and by kind of chemistry.

You see product groups, never product names, container numbers or who supplies them. That is the level the customer agreed to, and saying so is usually the fastest way to get a customer to raise it.

The page also says how many customers are not sharing. A customer showing you nothing is not a customer holding nothing, so treat a blank as a conversation to have rather than an account with no upside.

Chemicals on site now opens grouped by chemical, then site, then container size, which is the view to take into a visit.

Quick reference

If you want to	Go to
See everything one customer has	Customers, then open them
Prepare for a visit	Chemicals on site, filtered to them
Chase what is late	What is overdue for return
Send a monthly report	Report for a customer, choose the period, download the PDF
Answer a billing question	Deposits, filtered to the customer
Give them their own login	Their customer page, Invite as an organisation

If something goes wrong

What you see	What it means, and what to do
Can't reach Clariq	No phone signal where you are standing. Nothing was recorded and nothing was lost. Move to where you have signal and tap again.
The sign in link does not work	It has expired or has been used. Ask for another. Links are single use on purpose.
The button I want is not there	That step does not make sense for this container yet. The buttons you see are always the ones that are allowed right now.

The ? on every screen

Top right of the title. It opens the help for that exact screen, not a search box.

Ask Clariq

Type a question the way you would say it: "how do I print labels". You get the steps and a button that takes you there.

Dates are written day first throughout, for example 12-09-2026, and every export to Excel carries real dates so they sort properly.
