

Scanning chemicals in and out

Three things to know, and each of them takes about ten seconds. When a container arrives, scan it. When it is empty, say so. Once in a while, walk the store and tap what you see.

Who this is for	Anyone who receives or uses chemicals: site staff, store staff, workshop and facilities staff
Reading time	Five minutes, and you will not need it again
What you need	Your work phone or your own phone, and your work email address
Why bother	It replaces the stocktake walk before every audit

Your three jobs

You cannot break anything. Every button you are shown is one you are allowed to press, and if you record something wrongly, somebody corrects it. Nothing is lost, and nobody gets into trouble for scanning.

Getting set up, once

Signing in, once

1. Open `clariq-hub.netlify.app` in your phone browser

Type `clariq-hub.netlify.app` into Safari or Chrome. There is nothing to install.

2. Type your work email address, tap **Send me a link**

There is no password to remember. Clariq emails you a link that signs you in.

No email after a minute? Look in junk mail. The sender is Clariq.

3. Add Clariq to your home screen

iPhone: share button, then **Add to Home Screen**. Android: three dots, then **Install app**. After that it is one tap, and you stay signed in for 30 days.

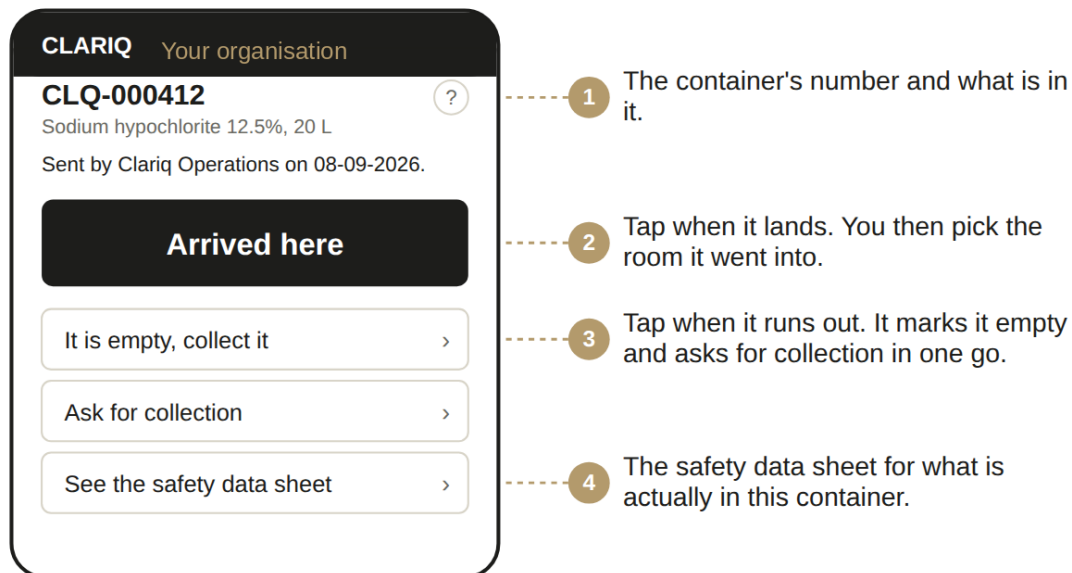

Use your own phone, not a shared one. Whatever you record is recorded as you, which is how the record is worth having. Signing in on somebody else's phone puts your name on their work.

Where to find help without asking anybody

Every screen has a ? at the top right that explains that screen. **Ask Clariq** answers questions typed the way you would say them, for example "how do I mark something empty".

When a container arrives

Do it at the trolley or the bench, not later from memory.

1. Open Clariq and tap Scan a container

Point the camera at the square code on the label, about a hand's width away.

2. Tap Arrived here, then pick the room

The room names are the ones your own people chose, so pick the one you are walking it into.

You will see: a green tick, and the container appears on your register in that room.

When it is empty, and when you want it gone

1. Scan it and tap It is empty, collect it

That one tap does two things: it records that the container is empty, and it asks your supplier to collect it. You do not need to email anybody.

2. Or tap Ask for collection

Use this when it is not empty but you want it gone anyway, for example the wrong product or a job that finished.

Once in a while: the audit walk

1. Menu, then Do an audit walk

Choose the room you are standing in. Clariq shows what it thinks is in there.

2. Scan or tap each container you can actually see

Each one turns green.

3. Leave anything you cannot find

Do not guess. The things that are missing are the useful part of the walk.

4. Tap Finish

That is the stocktake done, and it is recorded with your name and the date.

This is the bit that saves the most time. A walk that takes fifteen minutes with a phone used to be a morning with a clipboard and an afternoon typing it up.

Record everything you find, not just theirs

On a walk, record every container of chemicals you find, whoever supplied it. Your supplier's containers, your own bottles and another supplier's drums all belong on your register.

Recording how much is left is the point. A measured figure replaces what the register assumed, and the register then says audited, with the date. Anything you did not reach still reads as recorded, so the gap is visible rather than hidden.

Keep this on the store room wall

It arrived? Scan it. Tap **Arrived here**. Pick the room.

It is empty? Scan it. Tap **It is empty, collect it**.

If something goes wrong

What you see	What it means, and what to do
Can't reach Clariq	No phone signal where you are standing. Nothing was recorded and nothing was lost. Move to where you have signal and tap again.
The camera will not open	The app names the reason: permission not given, no camera, camera busy in another app, or an insecure address. Fix that one thing, tap retry.
The sign in link does not work	It has expired or has been used. Ask for another. Links are single use on purpose.
The button I want is not there	That step does not make sense for this container yet. The buttons you see are always the ones that are allowed right now.
I scanned the wrong room	Scan it again and pick the right one. The correction is recorded and nothing is lost.

✓ You can

- Scan any container and see what is in it
- Mark things arrived and empty, and ask for collection
- Do audit walks
- Open the safety data sheet from the container itself
- Read the register for your sites

X You cannot

- Change what is in a container
- Add sites, rooms or people. Ask your administrator
- See containers at another organisation
- Delete anything. Corrections are recorded instead
